                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 2, Application US/10093317;
Patent No. 6762043;
GENERAL INFORMATION:
APPLICANT: Beraud. Christophe
TITLE OF INVENTION: No. 6762043el motor proteins and methods for TITLE OF INVENTION: their use;
FILE REFRENCE: 1044;
CURRENT APPLICATION NUMBER: US/10/093,317;
CURRENT FILING DATE: 2002-03-66;
PRIOR FILING DATE: 2000-11-28;
NUMBER OF SEQ ID NOS: 8
SOFTWARE: FastSEQ for Windows Version 4.0

Patent No. 6440684

GENERAL INFORMATION:
APPLICANT: Beraud, Christophe
APPLICANT: Sakowicz, Roman
APPLICANT: Wood, Renneth
ITILE OF INVENTION: No. 6440684el motor proteins and methods for
ITILE OF INVENTION: their use
FILE REFERENCE: 1016
CURRENT FILING DATE: 2000-07-20
NUMBER OF SEQ ID NOS: 8
                                                                                                                                                 ö

Identifying a candidate agent as modulator of function of a target protein for treating cellular proliferation disorders by adding a candidate agent to a mixture of the target protein that directly/indirectly produces ADP or phosphate.

Claim 1; SEQ ID NO 4; 26pp; English.

This invention relates to a novel method for high throughput screening systems used to identify compounds for the treatment of cellular proliferation disorders. Specifically, it refers to candidate agents that are capable of modulating the activity of target proteins having motor

```
domains, such that the target protein directly or indirectly produces ADP or phosphate. Furthermore, this activity can be determined using fluorescence or absorbance readouts. The present invention describes a method that identifies modulators of the target protein, which is a kinesin-like DNA binding protein (known as KID) as cytostatic, cardiants, immunomodulators and antiinflammatories. Accordingly, through gene therapy, they can be used for the treatment of cancer, hyperplaais, restenosis, cardiac hypertrophy, immune disorders and inflammation. This polypeptide sequence is human KID protein (SeqID 4) of the invention.

The invention relates to human microtubule motor proteins and the nucleic acids encoding them. The invention also relates to a method of screening for modulators of a motor protein which has microtubule stimulated ArPase activity, a method of testing for ArPase activity of microtubule motor proteins, methods to identify candidate agents that bind to a target protein or act as a modulator of the binding characteristics or concerning to a carget protein, modulators of the target protein, and methods of treating callular proliferation disorders such as cancer, hyperplasias, restenosis, cardiac hypertrophy, immune disorders and inflammation, for treating disorders associated with kinesin-like DNA binding protein (KID) and for inhibiting KID. The sequences are used for screening for modulators of motor proteins useful for treating callular consideration disorders such as cancer, hyperplasias, restenosis, cardiac hypertrophy, immune disorders and inflammation, for treating disorders associated with KID and for inhibiting KID and for treating disorders associated with KID and for inhibiting KID and for treating disorders associated with KID and for inhibiting KID and for treating disorders associated with KID and for inhibiting KID and for treating disorders associated with KID and for inhibiting KID and for treating disorders and inflammatory bowell disease and consideration induced after medical procedures including surgery and candidate and procedures including surgery and candidate and procedures including surgery and candidate hy the mucleic acid featured as SBQ ID NO:3, but this does not NQRSSRSHAVLLVKVDQRERLAPFRQREGKLYLIDLAGSEDNRRTGNKGLRLKESGAINT 300 SLFVLGKVVDALNQGLPRVPYRDSKLTRLLQDSLGGSAHSILIANIAPERRFYLDTVSAL 360 361 NFAARSKEVINRPFTNESLQPHALGPVKLSQKELLGPPEAKRARGPEEEEIGSPEPMAAP 420 New isolated microtubule motor protein, useful for screening modulators for treating cellular proliferation disorders such as cancer, hyperplasias, restenosis, cardiac hypertrophy, immune disorders and 181 YQEKVLDLLDPASGDLVIREDCRGNILIPGLSQKPISSFADFERHFLPASRNRTVGATRL 61 ASDPPCVRGMDSCSLEIANWRNHQETLKYQFDAFYGERSTQQDIYAGSVQPILRHLLEGQ 61 ASDPPCVRGMDSCSLEIANWRNHQETLKYQFDAFYGERSTQQDIYAGSVQPILRHLLEGQ 121 NASVLAYGPIGAGKTHIMLGSPBQPGVIPRALMDLLQLIREEGAEGRPWALSVIMSYLEI 1 MPAAGGSTQQRRREMAAASAAAISGAGRCRLSKIGATRRPPPARVRVAVRLRPFVDGTAG 121 NASVLAYGPTGAGKTHTMLGSPEQPGVIPRALMDLLQLTREEGAEGRPWALSVTMSYLEI Gaps ö Length 512; Indels 100.0%; Score 2589; DB 8; 100.0%; Pred. The present invention describes a method for modulating the expression of a thanatos (death)-associated protein (THAP) responsive gene. The method comprises modulating the interaction of a THAP family polypeptide or its biological fragment with a nucleic acid, and so enhancing or repressing the expression of the THAP responsive gene. Also described: (1) a method of modulating the expression of a gene responsive to a THAP/Chemokine complex; (2) a pharmaceutical composition comprising a THAP responsive element in a pharmaceutical carrier; (3) a transcription factor decoy consisting essentially of a THAP responsive element; (4) a cell comprising a transcription factor decoy described above; (5) methods of modulating the interaction between a nucleic acid and a THAP-family comprising a transcription between a nucleic acid and a THAP-family collypeptide or its biological fragment, or a nucleic acid and a cell comprising a viral vector which comprises a promoter operably linked to a nucleic acid encoding a THAP-family polypeptide or its biological fragment; (7) a method of constructing a cell which expresses a recombinant THAP-family polypeptide or its biological combinant THAP-family polypeptide or its biological symptoms associated with a condition mediated by a THAP/chemokine complex
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Modulating expression of a Thanatos (death)-Associated Protein (THAP) responsive gene for preventing or treating e.g. cancer or inflammation, comprises modulating the interaction of a THAP polypeptide with a nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                        thanatos-associated protein; THAP; THAP responsive gene; THAP family; THAP responsive element; angiogenesis; inflammation; metastasis; cancer; apoptosis; cardiovascular disease; neurodegenerative disease; chemokine; antiangiogenic; antiinflammatory; cardiovascular; cytostatic; neuroprotective; osteopathic; THAP modulator; THAP synthesis modulator;

ta a THAP responsive element or that modulates transcription

at a THAP responsive element or that modulates the transport of a

CC demokine into the nucleus; (10) methods for reducing the symptoms

associated with a condition selected from excessive or insufficient

angiogenesis, inflammation, metastasis of a cancerous tissue, excessive

CC insufficient apoptosis, cardiovascular disease and neurodegenerative

diseases; symptoms associated with a condition resulting from the

activity of a chemokine or a THAP-family polypeptide in an individual; or

comprising a THAP-family polypeptide in an individual; (11) a vector

comprising a THAP-family polypeptide in an individual; (11) a vector

comprising a THAP-family polypeptide or nucleic acid

comprising a detectable product; (12) a genetically engineered cell

comprising the vector described above or that expresses a THAP-family

comprising the vector described above or that expresses a THAP-family

comprising a nucleic acid comprising a THAP responsive promoter,

comprising the vector described above or that expresses a THAP-family

comprising an nucleic acid comprising a THAP responsive promoter,

craction has antiangiogenic, antinflammatory, cardiovascular,

craction has antiangiogenic, antinflammatory, cardiovascular,

cromposition has antiangiogenic, antinflammatory, cardiovascular,

cytostatic, neuroprotective and osteopathic activities, and can be used

composition has mainangiogenic ariand series or insufficient

composition has present of a THAP responsive gene. Modulation us useful

composition has present sequence is cancerous tissue, excessive

con insufficient apoptosis, cardiovascular disease or neurodegenerative

con insufficient apoptosis, cardiovascular disease or neurodegenerative

confidence or invarior. 181 122 121 242 241 301 422 421 61 2 AAGGSTQQRRREMAAASAAAISGAGRCRLSKIGATRRPPPARVRVAVRLRPFVDGTAGAS 123 SVLAYGPTGAGKTHTMLGSPEQPGVIPRALMDLLQLTREEGAEGRPWALSVTMSYLEIYQ SVLAYGPTGAGKTHTMLGSPEQPGVIPRALMDLLQLTREEGAEGRPWALSVTMSYLEIYQ EKVLDLLDPASGDLVIREDCRGNILIPGLSQKPISSFADFERHFLPASRNRTVGATRLNQ RSSRSHAVLLVKVDQRERLAPFRQREGKLYLIDLAGSEDNRRTGNKGLRLKESGAINTSL FVLGKVVDALNQGLPRVPYRDSKLTRLLQDSLGGSAHSILIANIAPERRFYLDTVSALNF 63 DPPCVRGMDSCSLEIANWRNHQETLKYQFDAFYGERSTQQDIYAGSVQPILRHLLEGQNA DPPCVRGMDSCSLEIANWRNHQETLKYQFDAFYGERSTQQDIYAGSVQPILRHLLEGQNA **EKVLDLLDPASGDLVIREDCRGNILIPGLSQKPISSFADFERHFLPASRNRTVGATRLNQ** RSSRSHAVILVKVDQRERLAPFRQREGKLYLIDLAGSEDNRRTGNKGLRLKESGAINTSL FVLGKVVDALNQGLPRVPYRDSKLTRLLQDSLGGSAHSILIANIAPERRFYLDTVSALNF 3 AAGGSTQQRRREMAAASAAAISGAGRCRLSKIGATRRPPPARVRVAVRLRPFVDGTAGAS **AARSKEVINRPFINESLOPHALGPVKLSQKELLGPPEAKRARGPEEEIGSPEPMAAPAS AARSKEVINRPFTNESLOPHALGPVKLSOKELLGPPEAKRARGPEEEIGSPEPMAAPAS** Gapa ö 0; Indels Pred.                                                                                                                                                                                                                                                              ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention relates to a novel method for high throughput screening systems used to identify compounds for the treatment of cellular proliferation disorders. Specifically, it refers to candidate agents that are capable of modulating the activity of target proteins having motor domains, such that the target protein directly or indirectly produces ADP or phosphate. Furthermore, this activity can be determined using fluorescence or absorbance readouts. The present invention describes a method that identifies modulators of the target protein, which is a kinesin-like DNA binding protein (known as KID) as cytostatic, cardiants, immunomodulators and antiinflammatories. Accordingly, through gene therapy, they can be used for the treatment of cancer, hyperplasias, restenosis, cardiac hypertrophy, immune disorders and inflammation. This, polypeptide sequence is human KID protein (SeqID 8) of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              LKYQFDAFYGERSTQQDIYAGSVQPILRHLLEGQNASVLAYGPTGAGKTHTMLGSPEQPG 146

The invention relates to human microtubule motor proteins and the nucleic acids encoding them. The invention also relates to a method of screening for modulators of a motor protein which has microtubule stimulated ArPase activity, a method of testing for ArPase activity of microtubule motor proteins, methods to identify candidate agents that bind to a target protein or act as a modulator of the binding characteristics or biological activity of a target protein, modulators of the target protein, and methods of treating cellular proliferation disorders such as cancer, hyperplasts, restenosis, cardiac hypertrophy, immune disorders and inflammation, for treating disorders associated with kinesin-like DNA binding protein (KID) and for inhibiting KID. The sequences are used for
                                                                                                                                     446

The invention elates to novel isolated, enriched or purified nucleic acid molecules encoding a kinase polypeptide. The nucleic acid molecule comprises a sequence that: (a) encodes a kinase polypeptide; (b) is a complement of (a); (c) hybridizes under stringent conditions to (a) and complement of (a); (c) hybridizes under stringent conditions to (a) and complement of (b); (c) hybridizes under stringent conditions to (a) and complement of complement of complement of a catalytic domain, a C. terminal domain, a coiled-coil structure region, a spacer region and a C. terminal domain, a coiled-coil structure region, a spacer region and a C. terminal domain, a coiled-coil structure region, a spacer region and a C. terminal tail; or (e) is a complement of (d). The nucleic acid molecules, polypeptides, methods and substance are useful for treating cancers. C. terminal-associated diseases or disorders, cardiovascular disease, brain or cultural associated diseases, and metabolic disorders. The disorders are control or peripheral nervous system, Alzheimer's disease, to preferably cancers of the tissues or of hematopoietic origin, diseases of the central or peripheral nervous system, Alzheimer's disease, corrections, infections caused by fungi, ocular diseases, migraines, pain, bacteria, infections caused by fungi, ocular diseases, migraines, pain, centeria, infections caused by fungi, ocular diseases, migraines, pain, diseasus, metabolic disorders and organ transplant correction. This sequence corresponds to one of the kinase polypeptides of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      129

The prostate cancer antigens can have neuroprotective, cytostatic, cardioactive, immunomodulatory, muscular, vulnerary, gastrointestinal, nephrotropic, antiinfective, gynaecological and antibacterial activities, and can be used in gene therapy. The prostate cancer antigen polynucleotides may be used for detection of prostate cancer, chromosome identification, as chromosome markers, and for numerous other diagnostic or research purposes. The prostate cancer antigens may be used to treat disorders such as neural, immune, muscular, reproductive, gastrointestinal, pulmonary, cardiovagcular, renal, and proliferative disorders, wounds, and infectious diseases. This invention relates to a novel method for high throughput screening systems used to identify compounds for the treatment of cellular proliferation disorders. Specifically, it refers to candidate agents that are capable of modulating the activity of target proteins having motor domains, such that the target protein directly or indirectly produces ADP to phosphate. Furthermore, this activity can be determined using fluorescence or absorbance readouts. The present invention describes a method that identifies modulators of the target protein, which is a kinesin-like DNA binding protein (known as KID) as cytostatic, cardiants, immunomedulators and antinfilammatories. Accordingly, through gene therapy, they can be used for the treatment of cancer, hyperplasias, restenosis, cardiac hypertrophy, immune disorders and inflammation. This polypeptide sequence is human KID protein (SeqID 2) of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        122
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          242

The invention traces to numeral mistocubuse muctor processing and the invention traces to numeral mistocubuse muctor processing acidis encoding them. The invention which has microtubule stimulated Arpase activity, a method of testing for Arpase activity of microtubule motor proteins, methods to identify candidate agents that bind ca target proteins, methods to identify candidate agents that bind ca target protein or act as a modulator of the binding characteristics or protein, and methods of treating cellular proliferation disorders such as cancer, hyperplasias, restenosis, cardiac hypertrophy, immune disorders and inflammation, for treating disorders associated with kinesin-like DNA binding protein (KID) and for inhibiting KID. The sequences are used for screening for modulators of motor proteins useful for treating cardiac hypertrophy, immune disorders and inflammation, for treating associated with KID and for inhibiting KID and for treating autoimmune associated with KID and for inhibiting KID and for treating autoimmune cassociated with KID and for inhibiting KID and for treating autoimmune cassociated with KID and for inhibiting KID and for treating autoimmune considers associated with KID and for inhibiting KID.

Consideration induced after medical procedures including surgery and angioplasty. This sequence represents a human microtubule motor protein of the invention. Note: The specification states that this sequence is encoded by the nucleic acid featured as SEQ ID NO:1, but this does not
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   122
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   182

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention relates to a novel method for high throughput screening systems used to identify compounds for the treatment of cellular proliferation disorders. Specifically, it refers to candidate agents that are capable of modulating the activity of target proteins having motor domains, such that the target protein directly or indirectly produces ADP or phosphate. Furthermore, this activity can be determined using method or absorbance readouts. The present invention describes a method that identifies modulators of the target protein, which is a kinesin-like DNA binding protein (known as KID) as cytostatic, cardiants, therapy, they can be used for the treatment of cancer, hyperplasise, restenosis, cardiac hypertrophy, immune disorders and inflammation. This polypeptide sequence is human KID protein (SeqID 6) of the invention.
                                                                                                                                                                                                                                               human; enzyme; motor domain; kinesin-like DNA binding protein; KID; cytostatic; cardiant; immunomodulator; antiinflammatory; gene therapy; cancer; hyperplasia; restenosis; cellular proliferation disorder; cardiac hypertrophy; immune disorder; inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Identifying a candidate agent as modulator of function of a target protein for treating cellular proliferation disorders by adding a candidate agent to a mixture of the target protein that directly/indirectly produces ADP or phosphate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Length 346;
                                                                                                                                                                                                                      Human kinesin-like DNA binding protein (KID) (SeqID 6).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

```
The invention relates to human microtubule motor proteins and the nucleic acids encoding them. The invention also relates to a method of screening for modulators of a motor protein which has microtubule stimulated Arpase activity, a method of testing for Arpase activity of microtubule motor proteins, methods to identify candidate agents that bind to a target protein, protein or act as a modulator of the binding characteristics or protein, and methods of treating cellular proliferation disorders such as cancer, hyperplasias, restenosis, cardiac hypertrophy, immune disorders cancer, hyperplasias, restenosis, cardiac hypertrophy, immune disorders and inflammation, for treating disorders associated with kinesin-like DNA binding protein (KID) and for inhibiting KID. The sequences are used for screening for modulators of motor proteins useful for treating cellular screening for modulators of motor proteins useful for treating disorders such as cancer, hyperplasias, restenosis, cardiac hypertrophy, immune disorders and inflammation, for treating disorders

          The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eluciary for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176, and the encoded proteins (ABB57737-sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-printed specification, but was obtained in electronic form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         80
                                                                                                                                                                                                                                                                                                                                          The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA ABB12072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            388 KLSQKEL-LGPPEAKRARGPEEEIGSPEPMAAPASASQKLSPLQKLSSMDPAMLERLLS

The invention elates to novel isolated, enriched or purified nucleic acid molecule molecules encoding a kinase polypeptide. The nucleic acid molecule comprises a sequence that: (a) encodes a kinase polypeptide; (b) is a comprise an acquence that: (a) encodes a naturally occurring kinase polypeptide; (b) is a complement of (a), (c) hybridizes under stringent conditions to (a) and coordess a naturally occurring kinase polypeptide; (d) encodes the coordespoint of an encodes an actually occurring kinase polypeptide; (d) encodes the coordespoint of an except that it lacks one or more, but not all, of an opportune of the canalytic domain, a C-terminal domain, a coiled-coil structure region, a spacer region and a C-terminal tail; or (e) is a complement of (d). The nucleic acid molecules, polypeptides, methods and substance are useful for treating cancers, immune-related diseases or disorders, cardiovascular disease, brain or neuronal-associated diseases, and metabolic disorders. The disorders are perferably cancers of the tissues or of hematopoietic origin, diseases of the central or peripheral nervous system, Alzheimer's disease, brain, viral infections infections caused by fungi, ocular diseases, migraines, pain, cacteria, infections mood disorders, appropriate original disorders, dyskinesias, metabolic disorders, neurological disorders, dyskinesias, metabolic disorders and organ transplant criedian in this sequence corresponds to one of the kinase polypeptides of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 13;
New isolated, enriched or purified nucleic acid molecule encoding a
kinase polypeptide, useful for treating cancer, immune-related diseases,
cardiovascular disease, brain or neuronal-associated diseases and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

```

The invention relates to an isolated polynucleotide (a) comprising any of the 666 fully defined nucleotide sequences appearing as ADD499269 - CADD49935, ADD49936, and ADD49938, complements of (a); sequences of a teast 20 contiguous residuaes of (a); sequences that hybridise to (a) under highly stringent conditions; sequences having at least 75 or 90% identity to (a); or degenerate variants of (a). Also included are an isolated polypeptide (b) (comprising; sequences encoded by the new polynucleotide; any of the 4 amino acid sequences fully defined in the specification; or sequences having at least 70 or 98% identity to the sequence in (a) or (b)), an expression vector control sequence, a host colynucleotide operably linked to an expression control sequence, a host coll transformed or transfected with the above expression vector; an isolated antibody, or its antigen-binding fragment, that specifically binds to the above polypeptide, an oligonucleotide that hybridises to the converse entities of the finds to mean of the conditions, a finite mean of the conditions. fusion protein comprising at least one polypeptide cited above, detecting the presence of a cancer in a patient (comprising obtaining a biological sample from the patient; contacting the biological sample with a binding agent that binds to the polypeptide, or with the oligonucleotide cited above; detecting in the sample an amount of the polypeptide that binds to the binding agent, or an amount of a polypurcleotide that hybridises to the oligonucleotide; and comparing the amount of polypeptide, or polypurcleotide that hybridises to the oligonucleotide, to a predetermined cut-off value and then determining the presence of a cancer in the patient), a method for stimulating and/or expanding T-cells specific for a tumour protein (comprising contacting T-cells with the above 225 144 200 DCRGNILIPGLSQKPISSFADFERHFLPASRNRTVGATRLNQRSSRSHAVLLVKVDQRER 260 polypeptide, polynuclectide or antigen-presenting cells that express the polynuclectide, under conditions and for a time sufficient to permit the stimulation and/or expansion of Teells), an isolated T-cell population comprising T-cells prepared by the method, a composition comprising a first component selected from physiological carriers and immunostimulants and a second component selected from the above polypeptide, polynuclectide, antibody, fusion protein, T-cell population and antigen-presenting cells that express the above polypeptide, and antigen-presenting cells that express the above polypeptide, cesponse in a patient (comprising administering to the patient the above composition) treating lung cancer in a patient (comprising administering to the patient the above composition and a diagnostic kit (comprising: at least one oligonucleotide cited above; or at least one antibody cited above and a detection reagent comprises a reporter group). The composition and detection reagent comprises a reporter group). The composition and 83 49 QPDAFYGERSTQQDIYAGSVQPILRHLLEGQNASVLAYGPTGAGKTHTMLGS-----PEQ 145 P--GVIPRALMDLLQLTREEGAEGRPWALSVTMSYLEIYQEKVLDLLDPA--SGDLVIRE DPKEGIKIVGLTEKTVLVALDTVSCLEQGNNSRTVASTAMNSQSSRSHAIFTISLEQRKK 45 VRVAVRLRP-------FVDGTAGASDPPCVRGMDSCSLEIANWRNHQETLKY VRVALRCRPLVPKEISEGCOMCLSFVPG----EPQVVVGTDK-----SF LAPFROREGKLYLIDLAGSEDNRRTGNKGLRLKESGAINTSLFVLGKVVDALNQGLPR--Gaps methods are useful in diagnosing, preventing and treating cancer, particularly lung cancer. The present sequence is a lung cancer-associated antigen of the invention. 75; ; Score 574.5; DB 7; Length 1232; Pred.
